BOUND Protocol

On-demand liquidity for
tokenized real-world assets

Investor Pitch Deck
July 2026

PROBLEM

The tokenized RWA market has surged 5x to $33.5 Billion in mid-2026

Secondary market liquidity is almost non-existent; exit schedules remain locked in 30-to-90 day issuer-controlled redemption windows.

$34 trillion

Projected RWA market by 2034

SOLUTION

Liquidity Catalyst for the RWA Market

BOUND operates as a MiCA-compliant, shared on-chain liquidity layer that gives RWA holders instant exits on-demand while allowing RWA issuers to preserve stable background settlement timelines.

For RWA Issuers

Boosted Sales:
Attracts fresh capital by offering instantly liquidity for their products.

Protected Balance Sheets:
Protects the issuer's balance sheet from sudden, disruptive withdrawal pressure.

Regulatory Resilience:
MiCA Title II compliant utility-type architecture.

For RWA Users

Instant Exit Velocity:
Sell out of tokenized investments fast instead of waiting on rigid corporate schedules.

No Redemption Delays:
Bypass the standard 30-to-90 day issuer payout calendars completely.

Ultimate Simplicity:
Trade in and out of real-world assets on-demand through a clean digital dollar interface.

DeFi Liquidity Bridge vs. Locked RWA Pools

Permissioned Garden Walls
e.g., Ondo Nexus / Grove Basin

Exclusively built to service institutional tokenized Treasuries inside closed, approved networks.

Limit:
Structurally cut off from public DeFi due to KYC restrictions, leaving capital underutilized (e.g., BlackRock BUIDL has only 0.58% DeFi utilization).

Siloed RWA Bridges
e.g., Midas MSL / Upshift Clear

Requires issuers to lock up idle capital or bootstrap dedicated liquidity pools for each individual asset.

Limit:
Highly capital-inefficient. Liquidity is fragmented across an isolated pools, forcing issuers to accept a massive 2.5% yield drag just to support exits.

Bilateral RFQ Intermediation
e.g., Symbiotic / Liquid Lane

Relies on third-party market makers bidding to purchase discounted RWA positions during exits.

Limit:
Scalability is bottlenecked by the risk tolerance and balance sheet capacity of a few private market makers, making it a niche service rather than a universal standard.

The BOUND Solution

Clean Integration: rwaUSD is 100% USDC-backed, bypassing compliance and utility hurdles of RWA-backed stablecoins.

Unconstrained Scale: Scales dynamically to support any arbitrary asset class under a unified, shared reserve.

Quarantined Risk: BLI index absorbs all RWA defaults and liquidity shocks, keeping the senior peg protected.

Revenue Architecture

Institutional Service

One-time integration fees and recurring market maintenance revenue from RWA issuers

Transactional Velocity

Risk-tiered haircuts on incoming asset liquidations and premium fees for users opting for instant capital redemption

Algorithmic Surplus

Internalizing the arbitrage gains captured by the automated peg stabilization system, effectively manufacturing protocol-owned liquidity

Ecosystem Efficiency

Diversified income from entry and exit processing fees that fund the stabilization of the protocol's high-velocity liquidity layer

Protocol Architecture: Total Risk Isolation

rwaUSD — The Senior Layer

- **Fully Backed Stable Value:** Digital dollar token minted 1:1 against USDC.
- **Core Infrastructure:** Acts as the protocol's senior settlement rail.
- **Algorithmic Stability:** Price peg is defended atomically by the protocol.

BLI (Bound Liquidity Index) — The Junior Layer

- **Performance Tracker:** Tracks growth of underlying collateral base.
- **Risk Quarantine:** Isolates credit and asset illiquidity exposure.
- **Aligned Incentives:** Absorbs first-loss defaults while capturing fees.

The BOUND Reserve — The Capital Engine

- **Instant Exit Pipeline:** Supplies dollars for real-time RWA exits.
- **Productive Assets:** Earns base return through top-tier yield vaults.
- **Market Recycler:** Secondary market for recycling RWA inventory.

Competitive Liquidity Landscape

Protocol	Settlement Dollar	Pool Architecture	Exit Mechanism	Panic Resilience
BOUND Protocol	**Yes** (100% USDC Backed)	Shared Liquidity Layer	**Unilateral** (No Approval Needed)	**Yes** (Unilateral absorption)
Grove Basin	No (Rides on USDS/USDC)	Shared Credit Line ($1B)	Settlement-Gap Financing	No (Fund gate risk)
Liquid Lane	No (Pays Market Maker USDC)	Shared Collateral Vaults	Intermediary RFQ via 3rd party	No (3rd party refusal risk)
Midas	No (USDC through credit)	Tri-layered pool (Sleeve, OTC, MSL)	Hybrid Holdback (Delayed)	Vulnerable (Capacity exhaustion risk)
rxUSD (STBL)	Yes (rxUSD Stablecoin)	Multi-Collateral Layer	Direct Mint/Redeem Contract	No (Private credit depeg risk)

The Regulatory Moat

BLI is architected as an **index of protocol performance** rather than a payment token.

This legal framing bypasses the **"Stablecoin Interest Ban"** crippling competitors in Europe.

Legal Validation

Confirmed by 2 finalized Legal Opinions.

Asset Classification

Avoids AIFMD Fund classification by design.

Market Leadership

Positions BOUND as the default liquidity gateway.

Our Core Team

Georgian Ionita
Founder & CEO

- 9+ years experience across financial markets, crypto, and DeFi
- Financial Consultant at OVB (€400M+ group)
- Derivatives trader; transitioned to DeFi yield strategies in 2022
- Founder of IO Investment development firm

Joshua Oloma
Co-founder & CTO

- 10+ years experience building blockchain and distributed systems
- Led infrastructure for UK Gov and National Galleries of Scotland
- Co-Founder of IO Investment development firm

Eugene Shakula
Co-founder

- 10+ years of experience in BD and sales
- Grew VC portfolio from 0 to 70 projects
- Sales/implementation with Microsoft, Epson, and Panasonic

Investment Opportunity
